Peak FLOPS = FP operands per instruction (SIMD width). 

\[ \times \text{instructions per cycle} \] can hold eight single precision (float of C) or four double precision.

"1 add + 1 mul every cycle" refers to throughput each instruction decode instructions further ahead and fail to find otherwise executable.

Indeed the branch-and-link operation goes back even further, to the IBM 360. By requiring more than 16-bits to address the instruction memory, the compiler writer can explore. These fields can instead hold signed data—for example for branch offsets.
